BitQueens.

HANDOFF · PREPARED BY GEEXWEB.COM

Handoff

Written for the BitQueens team. It covers three things: **what must be decided before launch**, **how to change the words**, and **how to put the real domain on the site**. Nothing here needs a developer except where it says so.

The deeper technical reference is README.md; search and sharing setup is in SEO.md.

1. Where the site lives

Live URL	https://bitqueens-website.vercel.app
Code	https://github.com/imhaseeb8-design/BitQueens
Host	Vercel, connected to the `main` branch

Pushing to `main` deploys to production on its own; there is no publish button to press. A change is usually live about a minute after it is saved.

2. Before launch — decisions only BitQueens can make

Five pieces of what is on the site now were **invented as placeholders**. They look like real content, so they must be replaced or approved before the site is shown to the public.

WHAT	WHERE	WHY IT MATTERS
"Amara Okafor", member since 2026	`src/components/sections/Path.tsx:35`	A made-up member name on the homepage "Join" card. Either a real member who has agreed to appear, or change it to something obviously generic.
"Web3 Foundations · Week 2 of 4 · Beginner"	`src/components/sections/Path.tsx:44`	An invented course and progress bar on the "Learn" card.
"March 2027 · Lagos, Nigeria"	`src/content/home.ts:502`	A conference edition that has not been announced. It appears in the homepage hero chip.

WHAT	WHERE	WHY IT MATTERS
"Women in Web3: an open session", Thursday 26 March 2026	`src/content/conference.ts:39`	The single event on the Events page. Not a real event.
Kristie's bio	`src/content/home.ts:553`	Written as a stand-in, awaiting Kristie's own words. Her pull quote is deliberately empty.

Also unresolved:

- **Email addresses.** Everything on the site currently writes to `immanuelkristie@gmail.com`. `partnerships@bitqueens.org` and `events@bitqueens.org` are listed in `src/content/site.ts:73` but have not been confirmed as working mailboxes.
- **Photography.** None has been shot. Every image slot on the site states the ratio and the alt text it is waiting for, and shows a labelled placeholder until a photo is dropped in.
- **Programme names** on the Academy and Innovations pages are marked provisional in their content files.
- **The impact figures are real** — 2000+ women trained, 3 cohorts, 2 campus chapters, 8+ countries, supplied by BitQueens. No action needed.

3. Changing the words

Every word on the site lives in one folder: `src/content/`**.** No copy is buried in the layout. Each file is plain text between quote marks — editing one does not require understanding the code around it.

FILE	WHAT IT CONTROLS
`site.ts`	Navigation, buttons, email addresses, legal line
`home.ts`	The entire homepage
`about.ts`	About page
`academy.ts`	Academy page, tracks and cohorts
`ecosystem.ts`	Ecosystem page
`innovations.ts`	Innovations & Labs
`conference.ts`	Events page
`contact.ts`	Contact page
`join.ts`	Join page
`blog.ts`	Article list
`layout.ts`	Which variant an undecided section uses

Three ways to make a change, easiest first:

1. **Send the edits as a document.** Say which page and which sentence; a developer applies them in minutes.
2. **Edit on GitHub in the browser.** Open the file, click the pencil, change the text between the quote marks, and save with a short note. The site rebuilds itself. Keep the quote marks and the commas — they are the only things that can break.
3. **Run it locally.** `npm install`, then `npm run dev`. Requires Node.

Comments in those files beginning `TODO (BitQueens team)` or `NEEDS CONFIRMATION` mark every spot still waiting on a decision.

---

4. Connecting the real domain

A developer runs steps 2 and 3; step 1 is on the registrar.

1. **In Vercel** → the project → Settings → Domains → add the domain. Vercel gives DNS records to enter at whoever the domain is registered with. Choose one hostname as primary (with or without `www`) and let Vercel redirect the other.
2. **Set the canonical URL.** Add an environment variable `NEXT_PUBLIC_SITE_URL=https://the-real-domain` in Vercel, then redeploy. Page metadata, the sitemap and the structured data all read it.
3. **Submit to Google.** Verify the domain in Google Search Console, submit `/sitemap.xml`, and confirm the canonical URL it reports is the live one.

> **Warning, outstanding.** The canonical URL is currently set to `https://bitqueens.vercel.app`, which **does not exist** — it returns a 404 from Vercel. Until the real domain is attached, this must point at `bitqueens-website.vercel.app` instead, or search engines are told the site's true address is a dead page. Fix this before any launch announcement.

---

5. How the forms behave today

Every form on the site — contact, join, enrol, chapter, quote, event interest — **opens a pre-filled draft in the visitor's own email app**. The visitor reviews it and presses send. Nothing is stored and nothing is sent automatically, and each form says so on screen.

This is deliberate: it works with no accounts, no database and no monthly cost, and no personal data passes through anything that would need a privacy policy of its own.

If BitQueens would rather collect submissions in a dashboard or a spreadsheet, that is a small piece of work to add later; nothing on the page has to change.

The newsletter signup has no mailing-list connected — it validates the address and then says plainly that it cannot subscribe anyone yet. Wire it to the mailing-list provider before promoting it (`NewsletterForm.tsx:53`).

6. Things a visitor will never see

Three internal reference pages are published but hidden from search engines (`noindex`), used for reviewing design pieces side by side:

- `/preview-dots` — every dotted animation on the site
- `/preview-field` — the four dot-field shapes
- `/preview-conference` — event card variants

They are harmless to leave. Delete the folders in `src/app/` if you would rather they were gone.

---

7. What comes next

The site is built and every section works; what it needs now is **real content in place of the stand-ins**, and that arrives as BitQueens grows.

As you run cohorts, partner with organisations and gather results, send the material over and I will put it on the site:

- **Logos of companies and universities you have worked with** — they join the row on the homepage and the Ecosystem page.
- **Photographs** — cohorts, sessions, campus chapters, events, and a portrait of Kristie. Every image slot on the site is already shaped and waiting for one.
- **Updated figures** — women trained, cohorts delivered, chapters, countries. These sit in one place and take a minute to change.
- **Member stories and quotes** — with the person's permission to be named. These replace the invented member card in section 2.
- **Real events and programme details** — dates, venues, speakers, tracks, so the placeholders can come out.
- **Kristie's own bio and a pull quote** in her words.
- **A brand icon**, if you would rather the browser-tab mark were something other than the "B" currently drawn from the wordmark.

How to send it. Anything is fine — a shared folder, an email, a document. For logos, the original vector file (`.svg` or `.ai`) or a PNG with a transparent background works best; for photographs, the largest version you have, unedited. A line saying where each piece belongs is all the briefing needed.

There is no deadline on any of this. The site reads as finished today, and each piece makes it truer as it arrives.

---

8. Quality gates already in place

- Every push runs TypeScript and ESLint in GitHub Actions. A red check means read the failure before assuming the site is broken.

- Vercel type-checks each build; a build that fails is not deployed, so the live site cannot be broken by a bad save.
- The site has been checked down to 390px (iPhone 12 width) in Chromium. **A real iPhone Safari pass and measured Core Web Vitals are still outstanding** — browser engines differ, and neither can be proved by compilation.
